Agenda

• Introduction
• How the data is collected
• Lies, Damn Lies and Statistics
• Windows PC Malware
• Android Malware
• Network Impact
• Examples of malware
• DDOS
Monitoring the Mobile Network

• Monitor GTP-C traffic
  - Maps IMSI, APN & EMEI to IP address
  - Associates infection with a specific device or user

• Monitor GTP-U traffic
  - Malware C&C
  - Exploits
  - DDOS
  - Hacking

Detection Rules Development Process

- **MALWARE SAMPLES**
- **VIRUS VAULT**
  - 120K+ ANALYZED PER DAY
  - 30M+ Active samples
- **SANDBOX**
- **MALWARE TRAFFIC LIBRARY**
- **RULES DEVELOPMENT**
- **RULES LIBRARY**
- **RULE ACTIVATION**
- **RULES REPOSITORY**
- **DEPLOYMENT-SPECIFIC RULE SETS**
- **QUALITY TESTING**
- **FIELD TESTING IN LIVE NETWORKS**
- **FEEDBACK FROM FIELD TESTS**
- **TRAFFIC POLICY**
- **ZERO DAY BEHAVIORAL RULES**
Infection Rate

- C&C detection measures **actual infections** as seen from the network
- **Problem is growing** (by 25% in 2014)
- LTE device **5 times more likely to be infected**
However...

Estimates of Mobile Malware infection rates vary wildly
- ALU, Lookout & Google report 0.4% to 0.6%
- Verizon Breach Report quoted 0.03%
- Damballa quoted 0.0064% at RSA.

Google: “... US English devices have a PHA (potentially harmful app) installed on about 0.4% of devices, which is about 0.2% below the worldwide average.”

Source: Google Report - Android Security 2014 Year in Review
Also... Watch out for bad reporting in the press

Slight change in word order makes a huge difference:

What was said:

“31.7% of infected devices are in China”

What was reported in the press:

“31.7% of devices in China are infected”

Source: NQ Mobile (2013)

Number of Mobile malware samples grew 161% in 2014

- Samples grew by 161% in 2014
- 95% in Android space
- Download the full report on the Alcatel-Lucent website

Source: Alcatel-Lucent 2014 Malware Report
Android and Windows PC are the biggest targets

- ~50% of infected devices are Android
- ~50% are Windows PCs connected to the mobile network
- <1% iPhone, Blackberry, Symbian, Windows Mobile
- Note recent reduction in Android infections
Infection Rate by Device Type
Windows Malware impacts mobile networks

- Mainstream Professional Cybercrime

- Types
  - Botnets, Rootkits, SPAM, Identity Theft, Banking Trojans, DDOS, Ad-Click, Bitcoin, FakeAV, Ransomware, Hacktivism, Spyware...

- Examples
  - Proxy bot creates 800,000 TCP sessions and consumes 3GBytes of data in 24 hr period.
  - Roaming user draws botnet traffic from 4000 botnet peers around the world, all backhauled via his home network.
  - Bot checks in with C&C server every minute causing the radio connection to be reestablished each time.
Impact

• On the network
  - Bandwidth consumption
  - Radio signaling
  - Airtime

• Impact on user
  - Identity theft due to key loggers and password stealers
  - Financial loss due to banking trojans
  - Excessive charges due bandwidth usage
  - Extortion due to ransomware
  - Performance degradation due to consumption of computing and network resources.
  - Embarrassment from spaming and infecting friends
Android is mobile target of choice

- **Mostly trojanized apps** from 3rd party app stores or Google Play
- **Installed** by victim as a result of phishing or social engineering.
- **Types** (varies by region) : Adware, Info Stealers, Spy Phone, SMS Trojans, Banking Trojans, Fake Security Software
- **Impact** is low on the network so far but moderate to high on users
Android Malware

• Lacks Sophistication
  - C&C servers are hard coded in the source code as URL’s, domain names or IP addresses.
  - The C&C protocol is not robust and can be disrupted by taking out a single server.
  - The malware make no real attempt to conceal itself or avoid detection by anti-virus software.
  - The malware makes no attempt at persistence and can be removed by a simple uninstall.
Why Android?

• **Sideload**ing
  - Android apps can be download and installed from anywhere.
  - This provides the malware developer with an easy way to deliver the malware.
  - Some third part app stores specialize in pirated software with a high malware content.

• **Google Play**
  - Survey of 130k free apps in early 2014 showed 1/700 had some sort of malware content.
  - Google has greatly improved on this since then.
Why Android?

• **App Hijacking is trivial**

  1. Get the APK file for the target app
  2. Open it using “apktool d”
  3. Cut and paste the Trojan "smali" code directories into target app
  4. Edit the onCreate() function in the apps main activity to invoke the Trojan service
  5. Edit manifest to add the Trojan service and any required permissions
  6. Rebuild the app using “apktool b”
  7. Use “jarsigner” to sign the app (any key will do).
  8. Use “zipalign” to complete the process

This of course can be scripted...
Android vs Apple app security

- Signed with self signed certificates that are created by the developer.
- Available from a large number of third party app stores

- Signed with certificates issued by Apple and linked to the developer registration information.
- Only available from Apple.
Malware impacts the network and the user

**Bandwidth**
- SPAM
- DDOS
- Ad-Click Fraud

**Signaling**
- Command & Control
- Ad-Click Fraud
- Scanning

**Air Time**
- Command & Control
- Ad-Click Fraud
- Scanning

**Customer Experience**
- Identity Theft
- Financial Loss
- Excessive Charges
- Extortion
- Performance
- Embarrassment
# Top 20 Android Malware

UAPUSH

- **Uapush.A** is an Android adware Trojan with a moderate threat level.
- Sends IMSI, IMEI, contact information, bookmarks and call history to a C&C server in China.
- It also may send Short Message Service (SMS) messages without the user’s consent.
- Activity on this decreased steadily since the first half of the year.
SMSTRACKER

• **SMSTracker** is an Android spyphone app that provides a complete remote phone tracking and monitoring system for Android phones.

• It allows the attacker to remotely track and monitor all SMS, Multimedia Messaging Service (MMS), text messages, voice calls, GPS locations and browser history.

• This is also known as Android.Monitor.Gizmo.A.
NOTCOMPATIBLE

- Web Proxy Bot ported from Windows to Android environment.
- Uses same C&C as Windows version.
- Allows remote miscreants to anonymously browse the web through the victim’s phone.
- Consumes lots of bandwidth
  - 165MB in two hours over 300K TCP sessions
- Infection rate is currently only 0.03%
- In a network of 1M users that’s 600GB per day
KOLER

• Koler is an Android scareware Trojan that claims it has encrypted all the data on your phone and demands a ransom to restore the data.

The victims are usually visitors to Internet-based pornographic sites, who are duped into downloading and installing a “premium access video player.” The malware “lock-screen” is customized depending on the location of the phone. The screen image is from a United States based phone.
FAKEFLASH

• FakeFlash is a scam application distributed under the name “Install Flash Player 11.”
• It charges money for downloading and installing the Adobe Flash Player.
Mobile Spyware

• Mobile spyware is definitely on the increase. Six of the mobile malware in the 2014 top 20 list are mobile spyware.

• These are apps that are used to spy on the phone’s owner.

• They track the phone’s location, monitor ingoing and outgoing calls and text messages, monitor email and track the victim’s web browsing.

• Used by individuals, private investigators and in cyber espionage.
Impact of Scanning

• Cyber-criminals and security researchers often scan the Internet for vulnerable devices.

• In mobile networks these scans can cause excessive radio paging and signaling as large numbers of idle devices must be reconnected to the network to respond to the scan.

• Not a problem if the mobile subnets are NATed
DNS Amplification DDOS Attack in Mobile Network

- Mobile Wifi devices have been used in DNS DDOS amplification attacks
- Device configuration problem caused some devices to provide an internet facing recursive DNS service
- This attack is very similar to the Spark DDoS attack on Sept 8-9th 2014 in New-Zealand, where the mobile and fixed data services were down due to 138 compromised devices
Conclusion

- **Mobile Malware**
  - Currently lacks sophistication
  - Has relatively low infection rates (0.1%)
  - Greenfield opportunities include:
    - Spyphone (Tracking family, Private Investigators, Cyber Espionage)
    - SMS Trojans

- **Things to watch for**
  - Botnets move to mobile devices for SMS & Voice SPAM
  - More sophisticated C&C, persistence & stealth
  - DDOS against SMS and Voice
  - Hactivism goes mobile
  - Internet of Things gets hit
