Advanced Exploitation of Oracle PL/SQL Flaws

David Litchfield
(davidl@ngssoftware.com)
Objectives

- Discuss current “threat landscape”
- Introduce a new class of vulnerability
- Introduce a new method of attack
- Show practical demonstrations
- Look at some defences
Agenda

• PL/SQL Risks
  • SQL Injection
  • “Dangling” Cursor Snarfing
  • Cursor Injection

• Demonstrations
  • Grant DBA Privileges
  • Indirect Privilege Escalation
What is PL/SQL?

- Procedural Language / Structured Query Language
- Oracle’s extension to standard SQL
  Programmable like T-SQL in the Microsoft world.
- Used to create
  - Stored Procedures
  - Functions
  - Packages (collections of procedures and functions)
  - Triggers
  - Objects
- Extends functionality with External Procedures and Java
Privileges – Definer vs. Invoker rights

- PL/SQL executes with the privileges of the definer
  - A procedure owned by SYS executes with SYS privileges
- AUTHID CURRENT_USER keyword
  - PL/SQL created using the AUTHID CURRENT_USER keyword executes with the privileges of the invoker
  - A procedure owned by SYS but called by SCOTT executes with the privileges of SCOTT
- Analogous to Suid programs in the *nix world.
Running SQL from PL/SQL

- EXECUTE IMMEDIATE ‘…’
- OPEN
- DBMS_SQL
  - Key to Cursor Snarfing and Cursor Injection
DECLARE
MY_CURSOR NUMBER;
MY_RESULT NUMBER;
BEGIN
MY_CURSOR:=DBMS_SQL.OPEN_CURSOR();
DBMS_SQL.PARSE(MY_CURSOR, 'SELECT 1 FROM DUAL', 0);
MY_RESULT:=DBMS_SQL.EXECUTE(MY_CURSOR);
END;
/

DBMS_SQL Cursors

- Cursors are numbers… start from 1 to 300
- Unique to a specific session
- Like a handle – remains open ‘til closed
- If an exception occurs and the cursor is not closed in “cleanup” routines then the cursor is left “dangling”.
Cursor Snarfing

• If an attacker can cause an exception in higher privileged code where there are no cleanup routines then the attacker can re-use that cursor and gain access – sometimes limited, sometimes complete.

• Simple example – csnarf.txt

• We’ll come back to snarfing in a moment…
Contrived Example vulnerable procedure

CREATE OR REPLACE PROCEDURE GET_OWNER (P_OBJNM VARCHAR) IS
  TYPE C_TYPE IS REF CURSOR;
  CV C_TYPE;
  BUFFER VARCHAR2(200);
BEGIN
  DBMS_OUTPUT ENABLE(1000);
  OPEN CV FOR 'SELECT OWNER FROM ALL_OBJECTS WHERE OBJECT_NAME = '' || P_OBJNM || ''';
  LOOP
    FETCH CV INTO BUFFER;
    DBMS_OUTPUT.PUT_LINE(BUFFER);
    EXIT WHEN CV%NOTFOUND;
  END LOOP;
  CLOSE CV;
END;
Exploiting GET_OWNER() with only CREATE SESSION

- UNION SELECT
- Inject extant function
- Inject a cursor

Example: get_owner.txt
Real world example

MDSYS.SDO_DROP_BEFORE_USER contains the following SQL:

EXECUTE IMMEDIATE
'begin ' ||
'mdsys.rdf_api_internal.' ||
'notify_drop_user("" || dictionary_obj_name || "); ' ||
'end;';
Exploiting SDO_DROP_USER_BEFORE

1) Find a table anyone can insert into (e.g. OL$ owned by SYSTEM

2) Will inject into the SDO_DROP_USER_BEFORE to create another trigger on the OL$ table

3) This new trigger will give us DBA privileges

4) Insert into OL$ to fire the trigger

5) Demo – trigger.txt
Possible defences

Revoke execute on DBMS_SQL from PUBLIC… not a good idea; too many dependencies.

Trigger to prevent DML…
Questions and Answers

Any questions?
Thank You
