– Conclusion
Thinking about the concept

We’re from South Africa:
  – Robbery on Atterbury Road in Pretoria
  – Electric fencing around my house

From the insect world:
  – Acid bugs – “I don’t taste nice”
  – Electric eel

Spy vs. spy:
  – Disinformation
Introduction

Current trends in “assessment” space:
- Technology is getting smarter
- People are getting lazy
- Good “hacker” used to be technically clever
- Tool/scanner for every level of attack

Perceptions:
- Administrators are dumb, “hackers” are clever
- Skill = size of your toolbox

In many cases the mechanic’s car is always broken.
Types of defensive technology

Robbery analogy:
- Firewalls: Amour plated windows
- IDS: Police
- IPS: Driving away
- Back Hack: Carry a gun in the car

Fence analogy:
- Firewalls: Walls
- IDS: Police
- IPS: Armed response
- Back Hack: Trigger happy wife…
Raising the bar

Raising the “cost” of an “assessment”:
Attacking the technology, not the people
Attacking automation; “let’s move to the next target”

Used to be: “Are you sure it’s not a honey pot?”
Now:
– Is YOUR network safe?
– Are YOUR tools safe from attack?
– Do YOU have all the service packs installed?

– Do you measure yourself as you measure your targets?
Typical assessment methodology

• Foot printing
• Vitality
• Network level visibility
• Vulnerability discovery
• Vulnerability exploitation

• Web application assessment
**Attacks**

**Types:**
- Avoiding/Stopping individual attacks
- Creating noise/confusion
- Stopping/Killing the tool
- Killing the attacker’s host/network

**Levels:**
- Network level
- Network application level
- Application level
Attacks

Attack vectors:
All information coming back to the attacker is under OUR control:
- Packets (and all its features)
- Banners
- Forward & reverse DNS entries
- Error codes, messages
- Web pages

Used in the tool/scanner itself
Used in rendering of data, databases
Used in secondary scanners, reporters
Examples

Foot printing:

Avoiding DNS obfuscation

Noise:
“Eat my zone!”

Stopping:
Endless loop of forward entries

Killing:
Eeeevil named...reverse entries
Examples

Foot printing:

Tools:
Very basic – host, nslookup, dig
Domains: not a lot we can do there.
DNS entries: forward, reverse, axfr, ns

SensePost has some interesting foot printing tools…
Examples

[root@wom wom dnsjava-1.6.2]# java jnamed jnamed.conf
jnamed: listening on 0.0.0.0#53
jnamed: running

$ host -al 67.30.196.in-addr.arpa 196.30.67.73 | grep IN

1.67.30.196.in-addr.arpa.  86400 IN  PTR pokkeld.sensepost.com.
100.67.30.196.in-addr.arpa.  86400 IN  PTR haroon.sensepost.com|ls.
102.67.30.196.in-addr.arpa.  86400 IN  PTR mh.sensepost.com |ls.
Examples

Network level:

Avoiding Firewall

Noise:

- honeyd & transparent reverse proxies
- Random IPs alive
- Random ports open
- Traceroute interception/misdirection
- Fake network broadcast addresses

Stopping:
- ?

Killing:
- nmap with banner display??
Examples

Network level:

Tools:
Ping sweeps / vitality checkers
Port scanners
nmap, paketto/pulse, superscan, visualroute, some custom scripts, etc. etc.
#!/bin/perl

Examples

Network application level

Avoiding
  Patches, patches

Noise:
  – Fake banners
  – Combined banners
  – NASL (reverse) interpreter

Stopping:
  – Tar pits

Killing:
  – Buffer overflows
  – Rendering of data – malicious code in HTML
  – Where data is inserted into databases
  – Scanners that use other scanners (e.g. using nessus,nmap)
Examples

Network application level

Tools:

Shareware: Nessus, amap, httpprint, Sara & friends?

Commercial: ISS, Retina, Typhon, Foundscan, Qualys, Cisco
Examples

Application level & (web server assessment)

Avoiding

Application level firewall

Noise:
- On IPs not in use:
  - Random 404,500,302,200 responses
  - Not enough to latch “friendly 404”, or intercept 404 checking
- Within the application
  - Bogus forms, fields
  - Pages with “ODBC ….”

Stopping:

Spider traps, Flash, Human detectors

Killing:
- “You are an idiot!”
- Bait files.. Admintool.exe and friends in /files,/admin etc.
Examples

Tools:

Shareware: Nikto, Nessus, Whisker?, WebScarab, Exodus, Pharos, Spike, Httrack, Teleport pro

Commercial: Sanctum Appscan, Cenzic Hailstorm, Kavado Scando, SPI Dynamics WebInspect, @stake webproxy

### Header Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Delete</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>image/gif, image/x-xbitmap, image/jpeg, image/pjpeg, application/vnd.ms-excel, application/vnd.ms-powerpoint, application/vnd.ms-fontobject, image/vnd.ms-icon, image/png, image/x-icon, text/css, text/html, text/xml, application/json, text/javascript, application/atom+xml, application/rss+xml, application/syndication+xml</td>
<td></td>
</tr>
<tr>
<td>Accept-Language</td>
<td>en-us</td>
<td></td>
</tr>
<tr>
<td>Cookie</td>
<td>poef=waysecret</td>
<td></td>
</tr>
<tr>
<td>User-Agent</td>
<td>Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1)</td>
<td></td>
</tr>
<tr>
<td>Host</td>
<td>196.30.67.30</td>
<td></td>
</tr>
<tr>
<td>Connection</td>
<td>close</td>
<td></td>
</tr>
</tbody>
</table>
Examples

Armpit2
With IPS

Diagram:
- Incoming connection
  - Bad cookie jar
    - Back to client
  - Valid cookie?
    - yes
    - Back to client
    - no
  - Relay connection
    - yes
    - Build and send Flash
    - no
    - Valid request string?
      - yes
      - Send valid cookie and close connection
      - no
    - Evil requests
      - yes
      - BlackList Cookie & close connection
      - no

Combining with IPS

You are naughty
I will blacklist your Cookie

Conclusion

• These techniques do not make your network safer?
• IPS is getting smarter
  – The closer to the application level they go, the more accurate they become.
• IPS can easily switch on “armpits”
• It’s a whole new ballgame…
