# PROJECT

## Who we are and what we have done for you lately

#### П 0 Ν П Υ NE Т Р R 0 . П н С т

#### **Speaker**

- Lance Spitzner
  - The full-time Honeynet Project Pimp and Whip Cracker.
- Edward Balas
  - Sebek lead
- Rob McMillen
  - Honeywall Guru

#### **Purpose**

To explain the Honeynet Project, Honeynets, and demonstrate the latest technologies.

### Agenda

- The Project and Research Alliance
- Honeynets
- Sebek2

## **Honeynet Project**

#### Problem

How can we defend against an enemy, when we don't even know who the enemy is?

#### **The Honeynet Project**

- All volunteer organization of security professionals dedicated to researching cyber threats.
- We do this by deploying networks around the world to be hacked.

#### **Mission Statement**

To learn the tools, tactics, and motives of the blackhat community, and share the lessons learned.

#### Goals

- <u>Awareness</u>: To raise awareness of the threats that exist.
- Information: For those already aware, to teach and inform about the threats.
- <u>Research</u>: To give organizations the capabilities to learn more on their own.

### **Project History**

- The group informally began in April, 1999 as the [Wargames] maillist.
- Officially called ourselves the Honeynet Project in June, 2000.
- Formed Honeynet Research Alliance in January, 2002.

#### Value of the Project

- Totally Open Source, sharing all of our work, research and findings.
- Everything we capture is happening in the wild (there is no theory.)
- Made up of security professionals from around the world.
- We have no agenda, no employees, nor any product or service to sell (*crummy business model*).

### **Project Organization**

- Non-profit (501c3) organization
- Board of Directors
- No more then two members from any organization.
- Diverse set of skills and experiences.
- Team works virtually, from around the world.

#### **Honeynet Research Alliance**

Starting in 2002, the Alliance is a forum of organizations around the world actively researching, sharing and deploying Honeynet technologies.

http://www.honeynet.org/alliance/

#### **Alliance Members**

- South Florida Honeynet Project
- netForensics Honeynet
- Azusa Pacific University
- Paladion Networks Honeynet Project (India)
- Internet Systematics Lab Honeynet Project (Greece)
- AT&T Mexico Honeynet (Mexico)
- Honeynet.BR (Brazil)
- Irish Honeynet
- Norwegian Honeynet
- UK Honeynet

## Honeynets

#### Honeypots

- A security resource who's value lies in being probed, attacked or compromised.
- Has no production value, anything going to or from a honeypot is likely a probe, attack or compromise.

#### **Advantages**

- Collect small data sets of high value.
- Reduce false positives
- Catch new attacks, false negatives
- Work in encrypted or IPv6 environments
- Simple concept requiring minimal resources.

#### **Disadvantages**

- Limited field of view (microscope)
- Risk (mainly high-interaction honeypots)

#### **Examples of honeypots**

- Honeyd
- Specter
- ManTrap
- NetBait
- Honeynets

## Honeyd monitoring unused IPs

#### н П 0 Ν п Υ Ν П Т Ρ R 0 J П L С т

#### **Honeypots: Learn More**

http://www.tracking-hackers.com

#### Honeynets

- Nothing more then one type of honeypot.
- High-interaction honeypot designed to capture in-depth *information*.
- Its an architecture, not a product or software.
- Populate with live systems.

#### How it works

- A highly controlled network where every packet entering or leaving is monitored, captured, and analyzed.
- Any traffic entering or leaving the Honeynet is suspect by nature.

http://www.honeynet.org/papers/honeynet/

#### **Honeynet Requirements**

- Data Control
- Data Capture
- Data Collection (for distributed Honeynets)

http://www.honeynet.org/alliance/requirements.html

#### **Honeynet - Genll**

#### **Data Control - Genll**

alert tcp \$EXTERNAL\_NET any -> \$HOME\_NET 53
(msg:"DNS EXPLOIT named";flags: A+;
content:"|CD80 E8D7 FFFFFF|/bin/sh";
replace:"|0000 E8D7 FFFFFF|/ben/sh";)

http://snort-inline.sourceforge.net

#### Sebek

#### Its all about observation

- How do you observe and intruder without their knowledge?
- In Cliff Stoll's adventures at Berkeley, he monitored the serial lines that the intruder used to access the system in question.
- Today's approach is similar, we now catch packets off the network.

### **The complicating factor**

- Network packet captures are a great source of information.
  - TCP session reassembly
  - FTP file extraction.
- What happens if the intruder encrypts his or her session?
- Do we brute force the encryption?
- Is there a easy way to circumvent the encryption?

#### **The Arms Race**

- 1. Blackhats start to use session encyption to protect their communications
- 2. Honeynet operators installed trojaned shells to capture keystrokes
- 3. Blackhats installed their own shell as part of their rootkit
- 4. Honeynet operators started to look at Data Capture from within the kernel.

## Circumventing Encryption

- Sebek was born out of a desire to observe intruder behavior even when session encryption was in use.
- This meant either breaking the encryption or circumventing it.
- Sebek does not break the encryption it just does an end run around it.

#### What does Sebek do?

- Operates inside kernel space, gathering forensic data of interest to researchers.
- Once gathered, it "invisibly" exports this data to a remote collector.
- Examples of the types of data it can collect:
  - keystrokes
  - secure file transfers using SCP
  - Burneye passwords
  - All kinds of other stuff too!

## Whats changes since last years talk?

- There are efforts to port Sebek to:
  - OpenBSD
  - XP
  - Solaris
- New packet hiding capabilities added
- Records all read data now (no more blind spots).
- Resides entirely in kernel space, almost entire rewrite of all code.
- New web based data analysis tool

#### **Who developed Sebek**

- Sebek is a collaborative effort within the Honeynet Project.
  - Edward Balas
     Linux & Data Analysis
  - Job de Hass Solaris
  - K2
     Solaris
  - Mike Davis
     Windows XP
  - Dragos Ruiu
     OpenBSD
- Originally based on the Adore Rootkit and coded by Mike Clark for the linux OS.

#### **Sebek Design**

- There are 2 components:
  - The client, which collects the data on the honeypot and exports it to the server.
  - The server, which records and processes the data exported by honeypots.

#### **The Sebek client**

- For this presentation we will focus on the Linux version of Sebek.
- Sebek is currently implemented as a Linux Kernel Module(LKM).
- The first version of Sebek was based on the Adore Rootkit. This is no longer true.
- Sebek records any data that is accessed via the sys\_read call.
- Can record all sys\_read activity or just keystrokes.

## How does it get access to this data?

- It changes the syscall\_table, so when someone does a read system call, our code is executed.
- All data accessed via the sys\_read call is recorded.
- After the data is recorded it is immediately exported to the collector.

#### **Data Capture Illustration**

#### **Data Export**

- Sebek creates its own ethernet frames
- Sends them directly to the ethernet driver
- The packets bypass all filtering and packet capture code paths.
- This makes it impossible for a user on the honeypot to see the Sebek packets leaving the host.

#### **Data Export Illustration**

#### **Data Export part 2**

- At install time, the module also installs its own version of the raw socket implementation.
- This new implementation has a feature to silently drop packets which have a matching magic value in the packet header.
- This allows Sebek to not only hide its own packets but also packets from other honeypots.

#### The captured data

- The data is exported to a collector using using UDP.
- Each packet contains exactly one Sebek record.
- The packets are generated entirely in Sebek, and require a static IP to MAC mapping.

#### **The Data Export Format**

- Sebek packets have two components:
  - a fixed length head
  - a variable length payload.
- The head contains 10 fixed length fields.
- The payload is binary data of the length defined in the head.

### **Packet Header Format**

Magic	u_int32_t	identifies packets to hide
Version	u_int8_t	version number
Counter	u_int32_t	packet counter
Time_Sec	u_int32_t	timestamp in seconds
Time_Usec	u_int32_t	residual microseconds
PID	u_int32_t	process ID
UID	u_int32_t	user ID
FD	u_int32_t	file descriptor number
СОМ	char[10]	command name
Len	u_int32_t	payload length

#### **Other features**

- Sebek can still modify the syscall\_table even if it's symbol isn't exported to kernel modules.
- The Sebek LKM is removed from the linked list of modules making it invisible to the system.
- No log files or any user space modifications required.

### **Install Tips**

- Delete the tarball from the system after install, or better yet burn it on cd and unmount the cd after install.
- Make sure the shell isn't recording the commands you issue to install Sebek.
- If you installed from the file system, you may want to consider a way of scrubbing that data from the FS buffer in /proc/kcore
- Set the correct Dest MAC address or the ethernet frames will be sent to every switch port.

#### **The Server Side**

- Captures Sebek packets.
- Uploads them into a mysql database
- Data is examined using the soon to be available web based analysis front end or a script that dumps keystroke logs.

#### **Data Analysis**

- Example shows a non-root user copying a file to his home directory.
- The file is a Burneye protected copy of a ptrace exploit.
- The user runs the binary and gains root access.

#### **Analysis Questions**

- Can we recover the SCPed file using the web interface?
- Can we determine the password used to run the Burneye binary?
- Can we determine exactly when the user gained root access?

## Looking at the SCPed file

- We have now recovered a file named malware from PID 1264 FD 0.
- After downloading, we examined the file with strings.
- "TEEE burneye TESO ELF Encryption Engine"
- This is a burneye binary

## Lets take a closer look at malware's activity

#### **Back to the Questions**

- We were able to recover the file named malware, which was transferred using SCP.
- The password used to run malware was "secret"
- The blackhat user gained root access
  - Timestamp 2003-7-23 20:04:01
  - Process ID 1318
  - File Descriptor 0

#### **Current Limits**

- Data export mechanism uses UDP and thus does not provide reliable stream transport.
- Nothing is perfect, and as such there are ways to detect Sebek on a host.
- Sebek often collects a good deal of data that is not of interest
- Being a kernel module if the system reloads then sebek isnt automatically reinstalled.

#### **The Future**

- Ability to compile directly into kernel
- Make harder to detect
- anti-anti-Sebek techniques ;-)
- provide a better facility for users to express what data they want to collect.
- improved data analysis.

### Where Can I get Sebek

- Old version of Sebek can be downloaded from <u>http://www.honeynet.org/tools/sebek</u>
- For questions or comments contact Edward Balas
  - ebalas@iu.edu
- New version will be available in next couple of weeks.

#### **The Next Steps**

#### **Bootable CDROM**

- Boot any PC into a Honeynet gateway (Honeywall)
- Simplified interface
- Preconfigured logging to central system

#### **User Interface**

- System management
- Data Analysis

### **Honeywall CDROM**

- Developed by Rob McMillen
- CDROM boots into Honeywall gateway

#### **User Interfaces**
